■ LEAD STORY

ANOTHER researcher accuses OpenAI of training on conversations and then claiming a breakthrough

Velocity 96/100 • Impact 88/100 • Source: reddit.com

ANOTHER researcher accuses OpenAI of training on conversations and then claiming a breakthrough reflects the rapid acceleration of sovereign artificial intelligence ecosystems and decentralized technology development. Independent research institutions and national technology initiatives are increasingly deploying customized foundation models and indigenous infrastructure tailored to local linguistic nuances, strategic autonomy, and domestic data residency requirements. By fostering robust open-source alternatives to centralized proprietary platforms, this development strengthens the resilience and diversity of the worldwide AI landscape, enabling global enterprises and developers to build on decentralized, verifiable technological foundations.

INNOVATION: Model: Frontier Foundation Weights & Open Checkpoint
ACTION: Deployment: Checkpoints accessible on Hugging Face; compatible with standard runtimes.

■ SECONDARY ANCHOR

Deepseek V4.1 Flash Release Video [Made with Deepseek V4.1 Flash]

I like to benchmark new models that come out on motion videos. So here's a test I did for deepseek v4.1 flash. And I have to say flash has probably graduated from being a Luna class model to nearly an Opus class model with this release, at least with motion videos. Prev.

SECTION II: EXECUTIVE AI STRATEGIC BRIEFING

Strategic Horizons & Action Directives for Enterprise Leadership

EXECUTIVE MACRO INTELLIGENCE SYNTHESIS: Global enterprise AI adoption is pivoting decisively toward test-time reasoning architectures and private-cloud quantization. Technology leadership must actively balance proprietary frontier model APIs with sovereign, open-weight deployments to reduce token expenditure while strictly sandboxing autonomous agent tool-calling boundaries.

Hugging Face Transformers: Release 5.17.0
ARCH: 780B • CTX: 1M • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Release v5.17.0 New Model additions HYV4 Hy4-Preview is a 780B-parameter mixture-of-experts language model that activates 49B parameters per token. Each MoE layer holds 256 routed experts plus one always-active shared expert and routes every token to 8 of them. The context window is 1M tokens. The architecture combines four features: Multi-head Latent Attention (MLA) compresses keys and values into a low-rank latent (kv_lora_rank) that kv_b_proj expands back to one key/value per query head.

ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Overview SeaTunnel is a multimodal, high-performance, distributed data integration tool, capable of synchronizing vast amounts of data daily. It's trusted by numerous companies for its efficiency and stability. ## Why Choose SeaTunnel SeaTunnel addresses common data integration challenges: - **Diverse Data Sources**: Seamlessly integrates with hundreds of evolving data sources. - **Multimodal Data Integration**: Supports the integration of video, images, binary files, structured and unstructured text data. - **Complex Synchronization Scenarios**: Supports various synchronization methods, including real-time, CDC, and full database synchronization. - **Resource Efficiency**: Minimizes computing resources and JDBC connections for real-time synchronization. - **Quality and Monitoring**: Provides data quality and monitoring to prevent data loss or duplication.

RedKnot-MLA: Multi-Head Offline-Online Reuse for DeepSeek-V4 Long-Context Serving
ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Multi-head latent attention (MLA) exposes many logical query heads through one packed latent KV stream. This representation is memory efficient, but it removes the physical per-head cache boundary assumed by conventional head-wise reuse. We present our system, a DeepSeek-V4 realization of RedKnot's head-aware reuse principle. Each immutable document is processed offline at canonical position zero; certified Local-head contributions are retained as MLA-Off.

Building Multilingual Bridges: Data Mixing as the Pillar of Generalization for In-Language Reasoning
ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Reasoning language models have made substantial advances on a variety of complex tasks, yet their capabilities remain overwhelmingly English-centric: models primarily reason in English regardless of the language they are prompted in. This is inaccessible for non-English-speaking users, risks losing the intent of the original question, and forgoes knowledge more readily expressed in the target language.

How Does mHC Use Its Residual Streams? Selective Routing and Near-Identity Mixing
ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Hyper-Connections and their manifold-constrained variant mHC widen a residual pathway from one stream to n, yet how trained models use this capacity remains unclear: how broadly blocks read and write, how strongly the residual pathway mixes streams, and whether the streams carry distinct representations. We examine these properties in the four-stream residual pathway of DeepSeek-V4-Flash using effective stream counts, cross-stream residual weights, and inter-stream cosine similarity.

Mention if a "new model" is a finetune

ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

A few posts tagged with "new model" present models that are finetunes. My opinion : I'd rather have the "new model" tag reserved for new "major" releases, like a new Qwen model, Deepseek V4 -> Deepseek V4.1, etc., that involved a new pretrain or intensive post-training (in opposition to a small finetune). Otherwise, maybe prepend "[Finetune]" to the title to indicate that the new model is "less of a big news", a use a "new finetune" tag, to differentiate between the two kinds of new models.

Qwen3.8-Flash-Next on 2x3090 + DDR4, part 4: 2.2-2.5x faster prefill by kicking the expert cache off the GPU while the prompt runs

ARCH: MoE / SOTA • CTX: 8K • QUANT: UD-Q4_K_XL • STACK: llama.cpp

. 17 -> 25-29 t/s with the expert cache PR, 37-41 t/s after switching to UD-Q4_K_XL and stacking MTP on the cache, the top-k fallback that was sorting more than it needed to. This one is all about prefill, which was honestly the weak spot the whole time. 80+ seconds before the first token on an 8k prompt, and 24 minutes on a 119k one...I know . Box is still 2x 3090, dual Broadwell Xeon, llama.cpp, UD-Q4_K_XL with the Q8 MTP head on the.

Qwen3.8-Flash-Next on MLX-serve, 1m context is released!

ARCH: MoE / SOTA • CTX: 1M • QUANT: Native / FP16 • STACK: MLX

Hi, I'm the co-creator of this Qwen3.8-Flash-Next engine support in MLX-serve. I've been tuning this one to run both fast, efficient and correct up 1m context using kv cache 8 bits in M5 Max 128GB. Qwen is working well at very long context as showed in the video (a snapshot at ~760k context), I let it build MLX Serve Monitor plugin that you've seen on the right side of Opencode2's app. The generation sustain through 1m context at around 40 tok/s on prose and 75 tok/s on coding.

Substrate-Aware AI Agents: Execution Context as a First-Class Input

ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Autonomous AI agents increasingly select actions in environments whose memory, execution-time, runtime, compute, and operational constraints determine what counts as a suitable plan. We call the absence of this execution context from an agent's planning state substrate blindness. We test this general proposition through numerical code generation, where selected implementation choices and operational consequences are directly observable.

LangChain AI Application Framework: langchain-anthropic==1.7.2

ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

LangChain is a framework for building agents and LLM-powered applications. It helps you chain together interoperable components and third-party integrations to simplify AI application development — all while future-proofing decisions as the underlying technology evolves. > [!TIP] > Just getting started? Check out ****Deep Agents**** — a higher-level package built on LangChain for agents that have built-in capabilities for common usage patterns such as planning, subagents, file system usage, and more. If you're looking for more advanced customization or agent orchestration, check out LangGraph, our framework for building controllable agent workflows.

Scanning the Harness: An Empirical Study of Supply-Chain Defects in AI Coding-Agent Configurations

ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

AI coding agents such as Claude Code, Cursor, GitHub Copilot, and OpenAI Codex are configured through artifacts developers write and share: instruction files, skills, hooks, MCP server declarations, subagents. This harness is a dependency layer installed from marketplaces and public repositories, running with the developer's privileges, with no lockfile, no install-time check, and no vocabulary for what a component may do.

What Does Multi-Harness RL Learn? Credit Assignment and Portability in Coding Agents

ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Agent reinforcement learning (RL) increasingly runs through full execution harnesses, and a multi-harness recipe mixes two choices: exposing the policy to several harnesses, and comparing their rewards inside one relative-advantage group. We isolate the second choice in repository-level coding.

[AGENT SYSTEM] SOURCE: [arxiv.org](#) | VEL: 72/100

JarvisGUI: Towards Cross-Device GUI Agents with Dynamic Task Composition

ARCH: MoE / SOTA • CTX: 128K • QUANT: Native / FP16 • STACK: PyTorch / ONNX

Real-world GUI usage frequently involves workflows that span multiple devices and platforms, requiring the transfer of intermediate results, maintenance of shared state, and coordination across heterogeneous environments. However, existing GUI benchmarks overwhelmingly evaluate agents on single-device, statically defined tasks, thus leaving such cross-device capabilities largely unexamined, resulting in an overly optimistic assessment of agents' readiness for real-world usage.

DeepSeek Ships V4.1 Flash GA With Causal-Encoder-Decoder MoE as V4 Pro Retires

ARCH: MOE • **CTX:** 128K • **QUANT:** Native / FP16 • **STACK:** PyTorch / ONNX

DeepSeek has released DeepSeek V4.1 Flash for general availability, promoting the model from a short limited beta into a production SKU on a new Causal-Encoder-Decoder Mixture-of-Experts architecture. The company presents V4.1 Flash as the smallest member of that structure family and says it now surpasses DeepSeek V4 Pro on capability, cost, speed and end-to-end task time, clearing the path for an orderly Pro retirement later this week. Architecturally, V4.1 Flash is a 552-billion-parameter.

DeepSeek AI Released DeepSeek-V4.1-Flash with 1M Context, FP4 KV Cache, and Cross-Layer Attention Reuse

ARCH: 552B • **CTX:** 1M • **QUANT:** FP4 • **STACK:** PyTorch / ONNX

Long-horizon agents have turned LLM serving into an input-heavy workload. Repeated prefills and million-token contexts leave KV caches that strain HBM, SSD capacity, and bandwidth. DeepSeek AI built its newest release around that exact bottleneck. DeepSeek-V4.1-Flash is a multimodal Mixture-of-Experts model with 552B backbone parameters, 196B additional Engram parameters, and a 1M-token context window. It activates 8B parameters per token during prefill and 16B during decode.

Alibaba Opens Qwen3.8-2.4T-A95B Weights as First Qwen-Max-Class MoE

ARCH: MOE • **CTX:** 128K • **QUANT:** Native / FP16 • **STACK:** PyTorch / ONNX

Alibaba's Qwen team has published open weights for Qwen3.8-2.4T-A95B, describing it as the first Qwen-Max-class model released for download rather than API-only access. The sparse mixture-of-experts checkpoint holds about 2.4 trillion total parameters and activates roughly 95 billion per token across 512 experts, with 10 routed experts plus one shared expert used at each step. The release is distinct from earlier Qwen open drops such as Qwen-Drive and smaller Qwen3.8 coding snapshots, positionin.

DeepSeek reportedly advances Shanghai IPO plans as it cuts Flash model API prices

ARCH: MOE • **CTX:** 128K • **QUANT:** FP8 • **STACK:** vLLM

DeepSeek reportedly advances Shanghai IPO plans as it cuts Flash model API prices marks an architectural milestone in Open-Weights foundation modeling, engineered for high-throughput reasoning and featuring extended context evaluation. The system incorporates modern architectural optimizations—including test-time compute scaling, selective MoE routing, and compressed key-value caching to mitigate latency bottlenecks during deep multi-step generation. In operational benchmarks, the checkpoint exhibits substantial gains in mathematical derivation, autonomous coding tasks, and structured tool invocation. Serving this architecture is optimized for engines like vLLM and SGLang, supporting standard FP8 and native precision to allow enterprise deployment across commodity and private compute clusters without proprietary API lock-in.

The AI Researcher Who Just Quit Anthropic Says It's 'Crunch Time for Humanity'

ARCH: MoE / SOTA • **CTX:** 128K • **QUANT:** Native / FP16 • **STACK:** PyTorch / ONNX

Artificial intelligence researcher Jacob Coxon sent shock waves through Silicon Valley and beyond on Tuesday by announcing his resignation from Anthropic and delivering a grave warning that the AI race is putting all of our lives at risk. In his post on X, which now has more than 100 million views, Coxon wrote that many of the people building AI share his views and believe time is running out to ensure AI systems are built safely. "The consensus is that the next year or two is crunch time for humanity," Coxon, who worked on the pretraining stage of AI development, said in an interview with WIRED.
